FeedLite™ Instructions and Information

Extend your hunting and viewing hours with the ***Feedlite™***. The ***Feedlite™*** is used to illuminate remote areas at night where animals feed or gather.

The ***Feedlite™*** was designed for long periods of use with low maintenance. The cross hairs of most hunting scopes can be seen up to 75 yards away, while higher quality scope cross hairs can be seen from much farther away. The ***Feedlite™*** is also excellent for use with bow hunting.

It easily mounts to your feeder or a pole. The solar panel recharges a 12 volt battery that powers 9 (3 LEDs in each cluster) white LED bulbs. The ***Feedlite™*** automatically turns on at dusk to let you view nocturnal animals. The angle of each cluster can be independently adjusted. The ***Feedlite™*** is great for hog hunting.

Get the most of your limited and valuable hunting time. There are many uses for this unique outdoor lighting product.

Feedlite™ Mounting Tips

Your **Feedlite™** easily mounts to flat or rounded surfaces such as typical feeder barrels. Self drilling/tapping screws are included. Simply bend the mounting ears to fit the contour of your feeder.

For bow hunting, some hunters suggest mounting your **Feedlite™** to a pole between your stand and your feeder. This lets you view the side of the animal, and it eliminates silhouetting or shadowing.

With the magnification of typical scopes and binoculars, mounting your **Feedlite™** directly to your feeder or a pole works well. Be creative with your mounting to fit your particular viewing needs.

The **Feedlite™** may be easily mounted to a T-Post with the optional Swivel T-Post Bracket.

Always mount your **Feedlite™** so the solar panel faces South so it receives direct unobstructed sunlight to keep the battery charged. Battery performance is critical for optimum lighting. With proper charging conditions, your **Feedlite™** will stay brightly lit all night.

The **Feedlite™** easily mounts on a pole.

Feedlite™ Storage, Transportation, and Non-Use

Storage

For storage, and during transportation, be sure the toggle switch is in the OFF position. Also disconnect one pole of the battery.

Your **Feedlite™** is designed to run at night continuously all year long. You do not have to turn it off if it is mounted in direct sunlight. If you have to turn it off for special circumstances, just flip the toggle switch from AUTO to OFF. The solar panel still charges the battery in the OFF position. If you have to leave it off for a week or more in the field, then also disconnect one pole of the battery. This will keep the battery from being overcharged. Batteries typically need replacing after one year of usage.

Cleaning

Clean the LED bulbs and solar panel with only a soft brush and water. Keeping the bulbs and solar panel clean will help insure optimum lighting.

Helpful Tips and Information

The higher you mount your **Feedlite™** the greater the spread of the light at ground level. If it is mounted too high, the light may be too dissipated for your particular needs. The recommended height is 4–7 feet.

Some hunters suggest mounting the **Feedlite™** in a way to see the entire side of the animal. This can be done by mounting it to a pole facing your feeder.

Always be sure of your target. The manufacturer and its distributors assume not responsibility for the use or misuse of this product. Practice hunting safety.

Know the game laws in your area. In most areas it is illegal to hunt game animals (such as deer) with the aid of artificial light. In many areas it is legal to hunt non-game animals (such as feral hogs and exotics) with the aid of artificial light. Always check-in with your local wildlife authorities to make sure you are in compliance with all game laws.
